# Exercise 1: Kernelized Multiclass SVM

For a data set  $\mathcal{D} = \{(\mathbf{x}^{(1)}, y^{(1)}), \dots, (\mathbf{x}^{(n)}, y^{(n)})\}$  with  $y^{(i)} \in \mathcal{Y} = \{+1, -1\}$ , assume that we are provided with a suitable feature map  $\phi : \mathcal{X} \rightarrow \Phi$ , where  $\Phi \subset \mathbb{R}^d$ . In the featureized SVM learning problem we are facing the following optimization problem:

$$\begin{aligned} \min_{\boldsymbol{\theta}, \theta_0, \zeta^{(i)}} & \frac{1}{2} \boldsymbol{\theta}^T \boldsymbol{\theta} + C \sum_{i=1}^n \zeta^{(i)} \\ \text{s.t. } & y^{(i)} \left( \langle \boldsymbol{\theta}, \phi(\mathbf{x}^{(i)}) \rangle + \theta_0 \right) \geq 1 - \zeta^{(i)} \quad \forall i \in \{1, \dots, n\}, \\ & \text{and } \zeta^{(i)} \geq 0 \quad i \in \{1, \dots, n\}, \end{aligned}$$

where  $C \geq 0$  is some constant.

(a) Argue that this is equivalent to the following ERM problem:

$$\mathcal{R}_{\text{emp}}(\boldsymbol{\theta}) = \frac{1}{2} \|\boldsymbol{\theta}\|^2 + C \sum_{i=1}^n \max(1 - y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0), 0). \quad \triangleleft$$

i.e., the regularized ERM problem for the hinge loss for the hypothesis space

$$\mathcal{H} = \{f : \Phi \rightarrow \mathbb{R} \mid f(\mathbf{z}) = \boldsymbol{\theta}^T \mathbf{z} + \theta_0, \boldsymbol{\theta} \in \mathbb{R}^d, \theta_0 \in \mathbb{R}\}$$

# Solution to Exercise 1 (a)

1. Identify that:  $\langle \boldsymbol{\theta}, \phi(\mathbf{x}^{(i)}) \rangle + \theta_0 = \boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0$ .
2. Check the conditions  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) \geq 1 - \zeta^{(i)}$  and  $\zeta^{(i)} \geq 0$ .
  - Case 1: if  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) \geq 1$ , then  $\zeta^{(i)} = 0$ . ►
  - Case 2: if  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) < 1$ , then  $\zeta^{(i)} = 1 - y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) > 0$ . ►

Combining both cases, we can write

$$\zeta^{(i)} = \max(0, 1 - y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0))$$

Plug in to the primal problem we can prove that it is equivalent to the  $\mathcal{R}_{\text{emp}}(\boldsymbol{\theta})$  using hinge loss.

## Solution to Exercise 1 (a)

1. Identify that:  $\langle \boldsymbol{\theta}, \phi(\mathbf{x}^{(i)}) \rangle + \theta_0 = \boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0$ .
2. Check the conditions  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) \geq 1 - \zeta^{(i)}$  and  $\zeta^{(i)} \geq 0$ .
  - ▶ Case 1: if  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) \geq 1$ , then  $\zeta^{(i)} = 0$ .  $\triangleright$
  - ▶ Case 2: if  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) < 1$ , then  $\zeta^{(i)} = 1 - y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) > 0$ .  $\triangleright$

Combining both cases, we can write

$$\zeta^{(i)} = \max(0, 1 - y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0))$$

Plug in to the primal problem we can prove that it is equivalent to the  $\mathcal{R}_{\text{emp}}(\boldsymbol{\theta})$  using hinge loss.

## Solution to Exercise 1 (a)

1. Identify that:  $\langle \boldsymbol{\theta}, \phi(\mathbf{x}^{(i)}) \rangle + \theta_0 = \boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0$ .
2. Check the conditions  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) \geq 1 - \zeta^{(i)}$  and  $\zeta^{(i)} \geq 0$ .
  - Case 1: if  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) \geq 1$ , then  $\zeta^{(i)} = 0$ .  $\triangleright$
  - Case 2: if  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) < 1$ , then  $\zeta^{(i)} = 1 - y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) > 0$ .  $\triangleright$

Combining both cases, we can write

$$\zeta^{(i)} = \max(0, 1 - y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0))$$

Plug in to the primal problem we can prove that it is equivalent to the  $\mathcal{R}_{\text{emp}}(\boldsymbol{\theta})$  using hinge loss.

## Solution to Exercise 1 (a)

1. Identify that:  $\langle \boldsymbol{\theta}, \phi(\mathbf{x}^{(i)}) \rangle + \theta_0 = \boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0$ .
2. Check the conditions  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) \geq 1 - \zeta^{(i)}$  and  $\zeta^{(i)} \geq 0$ .
  - ▶ Case 1: if  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) \geq 1$ , then  $\zeta^{(i)} = 0$ .  $\triangleright$
  - ▶ Case 2: if  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) < 1$ , then  $\zeta^{(i)} = 1 - y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) > 0$ .  $\triangleright$

Combining both cases, we can write

$$\zeta^{(i)} = \max(0, 1 - y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0))$$

Plug in to the primal problem we can prove that it is equivalent to the  $\mathcal{R}_{\text{emp}}(\boldsymbol{\theta})$  using hinge loss.

## Solution to Exercise 1 (a)

1. Identify that:  $\langle \boldsymbol{\theta}, \phi(\mathbf{x}^{(i)}) \rangle + \theta_0 = \boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0$ .
2. Check the conditions  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) \geq 1 - \zeta^{(i)}$  and  $\zeta^{(i)} \geq 0$ .
  - ▶ Case 1: if  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) \geq 1$ , then  $\zeta^{(i)} = 0$ .  $\triangleright$
  - ▶ Case 2: if  $y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) < 1$ , then  $\zeta^{(i)} = 1 - y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0) > 0$ .  $\triangleright$

Combining both cases, we can write

$$\zeta^{(i)} = \max(0, 1 - y^{(i)}(\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0))$$

Plug in to the primal problem we can prove that it is equivalent to the  $\mathcal{R}_{\text{emp}}(\boldsymbol{\theta})$  using hinge loss.

## Exercise 1 (b)

(b) Now assume we deal with a multiclass classification problem with a data set  $\mathcal{D} = \{(\mathbf{x}^{(1)}, y^{(1)}), \dots, (\mathbf{x}^{(n)}, y^{(n)})\}$  such that  $y^{(i)} \in \mathcal{Y} = \{1, \dots, g\}$  for each  $i \in \{1, \dots, n\}$ . In this case, we can derive a similar regularized ERM problem by using the multiclass hinge loss (see Exercise Sheet 4(b)):

$$\mathcal{R}_{\text{emp}}(\boldsymbol{\theta}) = \frac{1}{2} \|\boldsymbol{\theta}\|^2 + C \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y^{(i)}), 0), \quad \triangleleft$$

where  $\psi : \mathcal{X} \times \mathcal{Y} \rightarrow \mathbb{R}^d$  is a suitable (multiclass) feature map. Specify a  $\psi$  such that this regularized multiclass ERM problem coincides with the regularized binary ERM problem in (a).

## Solution to 1 (b)

1. Motivation: functional margin has form  $y(\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0)$ . We can turn it into a inner product, e.g. something like  $\langle \cdot, \boldsymbol{\theta} \rangle$ .
2. We need to merge  $\theta_0$  into the inner product. We can add a dummy feature 1 to  $\phi(\mathbf{x})$ , as  $\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0 = \langle (1, \phi(\mathbf{x}))^T, (\theta_0, \boldsymbol{\theta})^T \rangle$ . Define  $\tilde{\phi}(\mathbf{x}) = (1, \phi(\mathbf{x}))^T$ , and  $\tilde{\boldsymbol{\theta}} = (\theta_0, \boldsymbol{\theta})^T$ .
3. We can merge the coefficient  $y$  into  $\tilde{\phi}(\mathbf{x})$ , obtaining  $y\tilde{\phi}(\mathbf{x})$ .
4. We have transformed  $y(\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0)$  into inner product  $\langle y\tilde{\phi}(\mathbf{x}), \tilde{\boldsymbol{\theta}} \rangle$ .
5. Multiply with a magic number  $\frac{1}{2}$ . Consider  $\psi(\mathbf{x}, y) = \frac{1}{2}y\tilde{\phi}(\mathbf{x})$ .

## Solution to 1 (b)

1. Motivation: functional margin has form  $y(\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0)$ . We can turn it into a inner product, e.g. something like  $\langle \cdot, \boldsymbol{\theta} \rangle$ .
2. We need to merge  $\theta_0$  into the inner product. We can add a dummy feature 1 to  $\phi(\mathbf{x})$ , as  $\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0 = \langle (1, \phi(\mathbf{x}))^T, (\theta_0, \boldsymbol{\theta})^T \rangle$ . Define  $\tilde{\phi}(\mathbf{x}) = (1, \phi(\mathbf{x}))^T$ , and  $\tilde{\boldsymbol{\theta}} = (\theta_0, \boldsymbol{\theta})^T$ .
3. We can merge the coefficient  $y$  into  $\tilde{\phi}(\mathbf{x})$ , obtaining  $y\tilde{\phi}(\mathbf{x})$ .
4. We have transformed  $y(\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0)$  into inner product  $\langle y\tilde{\phi}(\mathbf{x}), \tilde{\boldsymbol{\theta}} \rangle$ .
5. Multiply with a magic number  $\frac{1}{2}$ . Consider  $\psi(\mathbf{x}, y) = \frac{1}{2}y\tilde{\phi}(\mathbf{x})$ .

## Solution to 1 (b)

1. Motivation: functional margin has form  $y(\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0)$ . We can turn it into an inner product, e.g. something like  $\langle \cdot, \boldsymbol{\theta} \rangle$ .
2. We need to merge  $\theta_0$  into the inner product. We can add a dummy feature 1 to  $\phi(\mathbf{x})$ , as  $\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0 = \langle (1, \phi(\mathbf{x}))^T, (\theta_0, \boldsymbol{\theta})^T \rangle$ . Define  $\tilde{\phi}(\mathbf{x}) = (1, \phi(\mathbf{x}))^T$ , and  $\tilde{\boldsymbol{\theta}} = (\theta_0, \boldsymbol{\theta})^T$ .
3. We can merge the coefficient  $y$  into  $\tilde{\phi}(\mathbf{x})$ , obtaining  $y\tilde{\phi}(\mathbf{x})$ .
4. We have transformed  $y(\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0)$  into inner product  $\langle y\tilde{\phi}(\mathbf{x}), \tilde{\boldsymbol{\theta}} \rangle$ .
5. Multiply with a magic number  $\frac{1}{2}$ . Consider  $\psi(\mathbf{x}, y) = \frac{1}{2}y\tilde{\phi}(\mathbf{x})$ .

## Solution to 1 (b)

1. Motivation: functional margin has form  $y(\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0)$ . We can turn it into a inner product, e.g. something like  $\langle \cdot, \boldsymbol{\theta} \rangle$ .
2. We need to merge  $\theta_0$  into the inner product. We can add a dummy feature 1 to  $\phi(\mathbf{x})$ , as  $\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0 = \langle (1, \phi(\mathbf{x}))^T, (\theta_0, \boldsymbol{\theta})^T \rangle$ . Define  $\tilde{\phi}(\mathbf{x}) = (1, \phi(\mathbf{x}))^T$ , and  $\tilde{\boldsymbol{\theta}} = (\theta_0, \boldsymbol{\theta})^T$ .
3. We can merge the coefficient  $y$  into  $\tilde{\phi}(\mathbf{x})$ , obtaining  $y\tilde{\phi}(\mathbf{x})$ .
4. We have transformed  $y(\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0)$  into inner product  $\langle y\tilde{\phi}(\mathbf{x}), \tilde{\boldsymbol{\theta}} \rangle$ .
5. Multiply with a magic number  $\frac{1}{2}$ . Consider  $\psi(\mathbf{x}, y) = \frac{1}{2}y\tilde{\phi}(\mathbf{x})$ .

## Solution to 1 (b)

1. Motivation: functional margin has form  $y(\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0)$ . We can turn it into an inner product, e.g. something like  $\langle \cdot, \boldsymbol{\theta} \rangle$ .
2. We need to merge  $\theta_0$  into the inner product. We can add a dummy feature 1 to  $\phi(\mathbf{x})$ , as  $\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0 = \langle (1, \phi(\mathbf{x}))^T, (\theta_0, \boldsymbol{\theta})^T \rangle$ . Define  $\tilde{\phi}(\mathbf{x}) = (1, \phi(\mathbf{x}))^T$ , and  $\tilde{\boldsymbol{\theta}} = (\theta_0, \boldsymbol{\theta})^T$ .
3. We can merge the coefficient  $y$  into  $\tilde{\phi}(\mathbf{x})$ , obtaining  $y\tilde{\phi}(\mathbf{x})$ .
4. We have transformed  $y(\langle \phi(\mathbf{x}), \boldsymbol{\theta} \rangle + \theta_0)$  into inner product  $\langle y\tilde{\phi}(\mathbf{x}), \tilde{\boldsymbol{\theta}} \rangle$ .
5. Multiply with a magic number  $\frac{1}{2}$ . Consider  $\psi(\mathbf{x}, y) = \frac{1}{2}y\tilde{\phi}(\mathbf{x})$ .

## Solution to 1(b): Continued

6. Then, for  $y \neq y^{(i)}$ , it follows that

$$\begin{aligned} & 1 + \tilde{\boldsymbol{\theta}}^T \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y^{(i)}) \\ &= 1 + \frac{1}{2} y \tilde{\boldsymbol{\theta}}^T \tilde{\boldsymbol{\phi}}(\mathbf{x}^{(i)}) - \frac{1}{2} y^{(i)} \tilde{\boldsymbol{\theta}}^T \tilde{\boldsymbol{\phi}}(\mathbf{x}^{(i)}) \\ &= 1 + \frac{1}{2} (y - y^{(i)}) \tilde{\boldsymbol{\theta}}^T \tilde{\boldsymbol{\phi}}(\mathbf{x}^{(i)}) \\ &= \begin{cases} 1 + \tilde{\boldsymbol{\theta}}^T \tilde{\boldsymbol{\phi}}(\mathbf{x}^{(i)}), & \text{if } y^{(i)} = -1 \\ 1 - \tilde{\boldsymbol{\theta}}^T \tilde{\boldsymbol{\phi}}(\mathbf{x}^{(i)}), & \text{if } y^{(i)} = +1 \end{cases} \\ &= 1 - y^{(i)} \tilde{\boldsymbol{\theta}}^T \tilde{\boldsymbol{\phi}}(\mathbf{x}^{(i)}). \end{aligned}$$

## Solution to 1 (b): Continued

7. Thus,

$$\begin{aligned}\mathcal{R}_{\text{emp}}(\boldsymbol{\theta}) &= \frac{1}{2} \|\boldsymbol{\theta}\|^2 + C \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + \tilde{\boldsymbol{\theta}}^T \psi(\mathbf{x}^{(i)}, y) - \tilde{\boldsymbol{\theta}}^T \psi(\mathbf{x}^{(i)}, y^{(i)}), 0) \\ &= \frac{1}{2} \|\boldsymbol{\theta}\|^2 + C \sum_{i=1}^n \max(1 - y^{(i)} \tilde{\boldsymbol{\theta}}^T \tilde{\phi}(\mathbf{x}^{(i)}), 0) \\ &= \frac{1}{2} \|\boldsymbol{\theta}\|^2 + C \sum_{i=1}^n \max(1 - y^{(i)} (\boldsymbol{\theta}^T \phi(\mathbf{x}^{(i)}) + \theta_0), 0).\end{aligned}$$

## Exercise 1 (c)

(c) Show that the regularized multiclass ERM problem in (b) can be written in the kernelized form:

$$\frac{1}{2}\beta^T \mathbf{K}\beta + C \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + (\mathbf{K}\beta)_{(i-1)g+y} - (\mathbf{K}\beta)_{(i-1)g+y^{(i)}}, 0),$$

where  $\beta \in \mathbb{R}^{ng}$  and  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$  for  $\mathbf{X} \in \mathbb{R}^{ng \times d}$  with row entries  $\psi(\mathbf{x}^{(i)}, y)^T$  for  $i = 1, \dots, n, y = 1, \dots, g$ , i.e.,

$$\mathbf{X} = \begin{pmatrix} \psi(\mathbf{x}^{(1)}, 1)^T \\ \psi(\mathbf{x}^{(1)}, 2)^T \\ \vdots \\ \psi(\mathbf{x}^{(1)}, g)^T \\ \psi(\mathbf{x}^{(2)}, 1)^T \\ \vdots \\ \psi(\mathbf{x}^{(n)}, g)^T \end{pmatrix}. \quad \triangleleft$$

Here,  $(\mathbf{K}\beta)_{(i-1)g+y}$  denotes the  $((i-1)g+y)$ -th entry of the vector  $\mathbf{K}\beta$ . *Hint:* The representation theorems tells us that for the solution  $\theta^*$  of  $\mathcal{R}_{\text{emp}}(\theta)$  it holds that  $\theta^* \in \text{span}\{(\psi(\mathbf{x}^{(i)}, y))_{i=1, \dots, n, y=1, \dots, g}\}$

## Solution to Exercise 1 (c)

$\theta^* \in \text{span}\{(\psi(\mathbf{x}^{(i)}, y))_{i=1, \dots, n, y=1, \dots, g}\}$  means that  $\theta$  is a linear combination of the spanning bases,

i.e.  $\theta = \mathbf{X}^T \beta$  for  $\beta \in \mathbb{R}^{ng}$  and

$$\mathbf{X} = \begin{pmatrix} \psi(\mathbf{x}^{(1)}, 1)^T \\ \psi(\mathbf{x}^{(1)}, 2)^T \\ \vdots \\ \psi(\mathbf{x}^{(1)}, g)^T \\ \psi(\mathbf{x}^{(2)}, 1)^T \\ \vdots \\ \psi(\mathbf{x}^{(n)}, g)^T \end{pmatrix}.$$

So for  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$ , we obtain

$$\|\theta\|^2 = \theta^T \theta = (\mathbf{X}^T \beta)^T \mathbf{X}^T \beta = \beta^T \mathbf{K} \beta$$

## Solution to Exercise 1 (c)

$\theta^* \in \text{span}\{(\psi(\mathbf{x}^{(i)}, y))_{i=1, \dots, n, y=1, \dots, g}\}$  means that  $\theta$  is a linear combination of the spanning bases,

i.e.  $\theta = \mathbf{X}^T \beta$  for  $\beta \in \mathbb{R}^{ng}$  and

$$\mathbf{X} = \begin{pmatrix} \psi(\mathbf{x}^{(1)}, 1)^T \\ \psi(\mathbf{x}^{(1)}, 2)^T \\ \vdots \\ \psi(\mathbf{x}^{(1)}, g)^T \\ \psi(\mathbf{x}^{(2)}, 1)^T \\ \vdots \\ \psi(\mathbf{x}^{(n)}, g)^T \end{pmatrix}.$$

So for  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$ , we obtain

$$\|\theta\|^2 = \theta^T \theta = (\mathbf{X}^T \beta)^T \mathbf{X}^T \beta = \beta^T \mathbf{K} \beta$$

## Solution to Exercise 1 (c)

$\theta^* \in \text{span}\{(\psi(\mathbf{x}^{(i)}, y))_{i=1, \dots, n, y=1, \dots, g}\}$  means that  $\theta$  is a linear combination of the spanning bases,

i.e.  $\theta = \mathbf{X}^T \beta$  for  $\beta \in \mathbb{R}^{ng}$  and

$$\mathbf{X} = \begin{pmatrix} \psi(\mathbf{x}^{(1)}, 1)^T \\ \psi(\mathbf{x}^{(1)}, 2)^T \\ \vdots \\ \psi(\mathbf{x}^{(1)}, g)^T \\ \psi(\mathbf{x}^{(2)}, 1)^T \\ \vdots \\ \psi(\mathbf{x}^{(n)}, g)^T \end{pmatrix}.$$

So for  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$ , we obtain

$$\|\theta\|^2 = \theta^T \theta = (\mathbf{X}^T \beta)^T \mathbf{X}^T \beta = \beta^T \mathbf{K} \beta$$

## Solution to Exercise 1 (c): Continued

Furthermore,

$$\boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y^{(i)}) = \boldsymbol{\beta}^T \mathbf{X} \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\beta}^T \mathbf{X} \psi(\mathbf{x}^{(i)}, y^{(i)})$$

Note that the result is a scalar.

- ▶ Recall that  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$ .
- ▶  $\psi(\mathbf{x}^{(i)}, y)$  is the  $((i-1)g + y)$ -th row of  $\mathbf{X}$ . (Similar argument for  $\psi(\mathbf{x}^{(i)}, y^{(i)})$ )
- ▶ So,  $\mathbf{X}\psi(\mathbf{x}^{(i)}, y)$  is the  $((i-1)g + y)$ -th row/column of  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$  (symmetric).
- ▶ So, the inner product  $\boldsymbol{\beta}^T (\mathbf{X}\psi(\mathbf{x}^{(i)}, y))$  is equivalent to: first compute  $\mathbf{K}\boldsymbol{\beta}$ , and then retrieve the entry in the  $((i-1)g + y)$ -th row.

Therefore,

$$\begin{aligned}\mathcal{R}_{\text{emp}}(\boldsymbol{\theta}) &= \frac{1}{2} \|\boldsymbol{\theta}\|^2 + C \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y^{(i)}), 0) \\ &= \frac{1}{2} \boldsymbol{\beta}^T \mathbf{K} \boldsymbol{\beta} + \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + (\mathbf{K}\boldsymbol{\beta})_{(i-1)g+y} - (\mathbf{K}\boldsymbol{\beta})_{(i-1)g+y^{(i)}}), 0)\end{aligned}$$

## Solution to Exercise 1 (c): Continued

Furthermore,

$$\boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y^{(i)}) = \boldsymbol{\beta}^T \mathbf{X} \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\beta}^T \mathbf{X} \psi(\mathbf{x}^{(i)}, y^{(i)})$$

Note that the result is a scalar.

- Recall that  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$ .
- $\psi(\mathbf{x}^{(i)}, y)$  is the  $((i-1)g + y)$ -th row of  $\mathbf{X}$ . (Similar argument for  $\psi(\mathbf{x}^{(i)}, y^{(i)})$ )
- So,  $\mathbf{X}\psi(\mathbf{x}^{(i)}, y)$  is the  $((i-1)g + y)$ -th row/column of  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$  (symmetric).
- So, the inner product  $\boldsymbol{\beta}^T (\mathbf{X}\psi(\mathbf{x}^{(i)}, y))$  is equivalent to: first compute  $\mathbf{K}\boldsymbol{\beta}$ , and then retrieve the entry in the  $((i-1)g + y)$ -th row.

Therefore,

$$\begin{aligned}\mathcal{R}_{\text{emp}}(\boldsymbol{\theta}) &= \frac{1}{2} \|\boldsymbol{\theta}\|^2 + C \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y^{(i)}), 0) \\ &= \frac{1}{2} \boldsymbol{\beta}^T \mathbf{K} \boldsymbol{\beta} + \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + (\mathbf{K}\boldsymbol{\beta})_{(i-1)g+y} - (\mathbf{K}\boldsymbol{\beta})_{(i-1)g+y^{(i)}}), 0)\end{aligned}$$

## Solution to Exercise 1 (c): Continued

Furthermore,

$$\boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y^{(i)}) = \boldsymbol{\beta}^T \mathbf{X} \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\beta}^T \mathbf{X} \psi(\mathbf{x}^{(i)}, y^{(i)})$$

Note that the result is a scalar.

- Recall that  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$ .
- $\psi(\mathbf{x}^{(i)}, y)$  is the  $((i-1)g + y)$ -th row of  $\mathbf{X}$ . (Similar argument for  $\psi(\mathbf{x}^{(i)}, y^{(i)})$ )
- So,  $\mathbf{X}\psi(\mathbf{x}^{(i)}, y)$  is the  $((i-1)g + y)$ -th row/column of  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$  (symmetric).
- So, the inner product  $\boldsymbol{\beta}^T (\mathbf{X}\psi(\mathbf{x}^{(i)}, y))$  is equivalent to: first compute  $\mathbf{K}\boldsymbol{\beta}$ , and then retrieve the entry in the  $((i-1)g + y)$ -th row.

Therefore,

$$\begin{aligned}\mathcal{R}_{\text{emp}}(\boldsymbol{\theta}) &= \frac{1}{2} \|\boldsymbol{\theta}\|^2 + C \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y^{(i)}), 0) \\ &= \frac{1}{2} \boldsymbol{\beta}^T \mathbf{K} \boldsymbol{\beta} + \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + (\mathbf{K}\boldsymbol{\beta})_{(i-1)g+y} - (\mathbf{K}\boldsymbol{\beta})_{(i-1)g+y^{(i)}}), 0)\end{aligned}$$

## Solution to Exercise 1 (c): Continued

Furthermore,

$$\boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y^{(i)}) = \boldsymbol{\beta}^T \mathbf{X} \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\beta}^T \mathbf{X} \psi(\mathbf{x}^{(i)}, y^{(i)})$$

Note that the result is a scalar.

- Recall that  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$ .
- $\psi(\mathbf{x}^{(i)}, y)$  is the  $((i-1)g + y)$ -th row of  $\mathbf{X}$ . (Similar argument for  $\psi(\mathbf{x}^{(i)}, y^{(i)})$ )
- So,  $\mathbf{X}\psi(\mathbf{x}^{(i)}, y)$  is the  $((i-1)g + y)$ -th row/column of  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$  (symmetric).
- So, the inner product  $\boldsymbol{\beta}^T (\mathbf{X}\psi(\mathbf{x}^{(i)}, y))$  is equivalent to: first compute  $\mathbf{K}\boldsymbol{\beta}$ , and then retrieve the entry in the  $((i-1)g + y)$ -th row.

Therefore,

$$\begin{aligned}\mathcal{R}_{\text{emp}}(\boldsymbol{\theta}) &= \frac{1}{2} \|\boldsymbol{\theta}\|^2 + C \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y^{(i)}), 0) \\ &= \frac{1}{2} \boldsymbol{\beta}^T \mathbf{K} \boldsymbol{\beta} + \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + (\mathbf{K}\boldsymbol{\beta})_{(i-1)g+y} - (\mathbf{K}\boldsymbol{\beta})_{(i-1)g+y^{(i)}}), 0)\end{aligned}$$

## Solution to Exercise 1 (c): Continued

Furthermore,

$$\boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y^{(i)}) = \boldsymbol{\beta}^T \mathbf{X} \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\beta}^T \mathbf{X} \psi(\mathbf{x}^{(i)}, y^{(i)})$$

Note that the result is a scalar.

- Recall that  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$ .
- $\psi(\mathbf{x}^{(i)}, y)$  is the  $((i-1)g + y)$ -th row of  $\mathbf{X}$ . (Similar argument for  $\psi(\mathbf{x}^{(i)}, y^{(i)})$ )
- So,  $\mathbf{X}\psi(\mathbf{x}^{(i)}, y)$  is the  $((i-1)g + y)$ -th row/column of  $\mathbf{K} = \mathbf{X}\mathbf{X}^T$  (symmetric).
- So, the inner product  $\boldsymbol{\beta}^T(\mathbf{X}\psi(\mathbf{x}^{(i)}, y))$  is equivalent to: first compute  $\mathbf{K}\boldsymbol{\beta}$ , and then retrieve the entry in the  $((i-1)g + y)$ -th row.

Therefore,

$$\begin{aligned}\mathcal{R}_{\text{emp}}(\boldsymbol{\theta}) &= \frac{1}{2} \|\boldsymbol{\theta}\|^2 + C \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y) - \boldsymbol{\theta}^T \psi(\mathbf{x}^{(i)}, y^{(i)}), 0) \\ &= \frac{1}{2} \boldsymbol{\beta}^T \mathbf{K} \boldsymbol{\beta} + \sum_{i=1}^n \sum_{y \neq y^{(i)}} \max(1 + (\mathbf{K}\boldsymbol{\beta})_{(i-1)g+y} - (\mathbf{K}\boldsymbol{\beta})_{(i-1)g+y^{(i)}}), 0)\end{aligned}$$

## Exercise 2: Kernel Trick

The polynomial kernel is defined as

$$k(x, \tilde{x}) = (x^T \tilde{x} + b)^d.$$

Furthermore, assume that  $x \in \mathbb{R}^2$  and  $d = 2$ . (a) Derive the explicit feature map  $\phi$  taking into account that the following equation holds:

$$k(x, \tilde{x}) = \langle \phi(x), \phi(\tilde{x}) \rangle$$

## Solution to 2 (a)

$$k(x, \tilde{x}) = (x^T \tilde{x} + b)^T = \left( \begin{pmatrix} x_1 \\ x_2 \end{pmatrix}^T \begin{pmatrix} \tilde{x}_1 \\ \tilde{x}_2 \end{pmatrix} + b \right)^2$$

## Solution to 2 (a)

$$\begin{aligned}k(x, \tilde{x}) &= (x^T \tilde{x} + b)^T = \left( \begin{pmatrix} x_1 \\ x_2 \end{pmatrix}^T \begin{pmatrix} \tilde{x}_1 \\ \tilde{x}_2 \end{pmatrix} + b \right)^2 \\&= (x_1 \tilde{x}_1 + x_2 \tilde{x}_2 + b)^2\end{aligned}$$

## Solution to 2 (a)

$$\begin{aligned}k(x, \tilde{x}) &= (x^T \tilde{x} + b)^T = \left( \begin{pmatrix} x_1 \\ x_2 \end{pmatrix}^T \begin{pmatrix} \tilde{x}_1 \\ \tilde{x}_2 \end{pmatrix} + b \right)^2 \\&= (x_1 \tilde{x}_1 + x_2 \tilde{x}_2 + b)^2 \\&= x_1^2 \tilde{x}_1^2 + 2x_1 \tilde{x}_1 x_2 \tilde{x}_2 + x_2^2 \tilde{x}_2^2 + 2bx_1 \tilde{x}_1 + 2bx_2 \tilde{x}_2 + b^2\end{aligned}$$

## Solution to 2 (a)

$$\begin{aligned}k(x, \tilde{x}) &= (x^T \tilde{x} + b)^T = \left( \begin{pmatrix} x_1 \\ x_2 \end{pmatrix}^T \begin{pmatrix} \tilde{x}_1 \\ \tilde{x}_2 \end{pmatrix} + b \right)^2 \\&= (x_1 \tilde{x}_1 + x_2 \tilde{x}_2 + b)^2 \\&= x_1^2 \tilde{x}_1^2 + 2x_1 \tilde{x}_1 x_2 \tilde{x}_2 + x_2^2 \tilde{x}_2^2 + 2bx_1 \tilde{x}_1 + 2bx_2 \tilde{x}_2 + b^2 \\&= \left\langle \begin{pmatrix} x_1^2 \\ \sqrt{2}x_1 x_2 \\ x_2^2 \\ \sqrt{2}bx_1 \\ \sqrt{2}bx_2 \\ b \end{pmatrix}, \begin{pmatrix} \tilde{x}_1^2 \\ \sqrt{2}\tilde{x}_1 \tilde{x}_2 \\ \tilde{x}_2^2 \\ \sqrt{2}b\tilde{x}_1 \\ \sqrt{2}b\tilde{x}_2 \\ b \end{pmatrix} \right\rangle \\&= \langle \phi(x), \phi(\tilde{x}) \rangle\end{aligned}$$

## Exercise 2 (b)

(b) Describe the main differences between the kernel method and the explicit feature map.

**Solution:** Using the kernel method reduces the computational costs of computing the scalar product in the higher-dimensional features space after calculating the feature map.

## Exercise 2 (b)

(b) Describe the main differences between the kernel method and the explicit feature map.

**Solution:** Using the kernel method reduces the computational costs of computing the scalar product in the higher-dimensional features space after calculating the feature map.
